Reaching Nationwide

We provide direct services to:

- ✓ Northern Ireland
- ✓ Republic of Ireland
- ✓ Isle of Man

We can service the other jurisdictions with our close relationships with our sister companies including:

- ✓ England
- ✓ Wales
- ✓ Scotland

Our accessibility and flexibility mean that we're able to respond quickly to jobs throughout these areas, helping to restore homes and premises efficiently.

Restoring Your Environment

Established in 2016 by experienced industry professionals looking to bring a fresh, science-led approach to the sector. Gaea Environmental is a specialist remediation consultancy and contractor delivering a full range of remediation solutions across the UK & Ireland.

We're proud of our strong reputation for delivering excellence in customer service, supported by a pragmatic and efficient approach to project turnaround.

We believe in honest and plain communication and never try to baffle anyone with scientific terminology as it is our belief that if something isn't explained in simple logical terms then it isn't understood.

We carefully manage the size of our organisation to ensure we don't get too large and lose the level of close control that we enjoy on projects that is reflected in continued customer satisfaction.

Accreditations

Our Approach

We understand that an oil spill can be an unsettling and difficult time for Property Owners, Property Managers and their tenants; it is crucial to GAEA that we involve and communicate with the customer at all stages of the project, treating them with respect and empathy.

Effective project management is key to the way we work. We manage projects efficiently and professionally, progressing each at a good pace. Fast identification and response to issues, enabled by strong knowledge and experience of a wide range of techniques and technologies, allows us to react and continue promptly. Importantly, our team will recommend a precise combination of solutions to remediate the site and no more; it's in everyone's interests that we return sites to customers as early as possible.

Clear Communication

Before we enter onto any site, we meet customers face-to-face in their home so that they can get to know us, and discuss with us in plain English the work we'll be doing, how long it will take and to ask us any questions.

Regular, honest and open communication throughout the project aims to minimise concerns and our senior team members are always on hand to guide customers and answer queries.

Great Service

We are proud of our team's strong reputation in the sector, consistently delivering:

GAEA Delivers:

- ✓ Strong customer service and client partnerships;
- ✓ Unparalleled technology and skills;
- ✓ A solutions-driven approach, utilising those techniques which will bring efficient and effective results;
- ✓ A hands-on and proactive management team, led by director-level experience; and
- ✓ A respectful and trusted approach to the homes of the families we work in.

Innovation

Creating Scientific Sustainability

At the core of Gaea's ethos is innovation. From survey to sign-off, we believe in challenging ourselves to find more efficient and effective ways of doing things.

Gaea Environmental believes in sustainability, and we strive to factor this core value into everything we do. It's important to us to ensure that the solutions we recommend and undertake are cost effective, efficient and generate the minimum waste possible.

Leading Remediation Methods

We continually develop and improve our working methods. Our engineering and fabrication division designs and constructs our own remediation equipment, as well as solutions for others throughout the British Isles, going considerably beyond commercially-available technologies to create truly bespoke and highly functional solutions which support Gaea's forward-thinking and proactive approach.

An extensive range of commissioned remedial apparatus is available to our clients, including:

- ✓ Multiphase extraction trailers that can be mobilised to almost any site
- ✓ Powerful vapour extraction units and negative pressure units
- ✓ A large number of automated treatment systems, each of which can be set up to suit any scenario and is remotely controlled and adjusted
- ✓ Specialised pumping systems for the removal of oils from water and groundwater.

Research Development For The Future

Gaea is constantly developing our technologies, and in conjunction with several universities and government bodies we are currently developing new chemical and physical process that we believe will revolutionise the industry.

Our Process

1. Initial Contact

2. Emergency Response If Needed

Stopping Leaks

Emergency Trenches

Drains / Rivers

Vapour Control

3. Arrange For An Initial Site Assessment

Normally within hours. If more detailed investigation is required such as in the rare cases where the oil has gone to depth or ground water we will arrange for this to be undertaken after the initial investigation.

4. Report Preparation

Insurers and regulators will require a detailed report which accurately explains what has happened and what damage has occurred to the various receptors such as Humans, Property, Groundwater, Surface Waters & any Neighbours. We aim to have our reports along with projected costings for the work compiled within a few days of visiting your property.

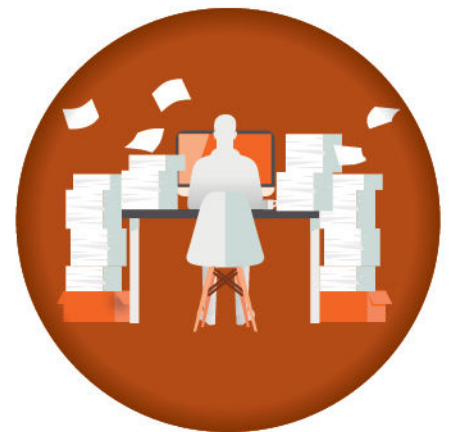

5. Report Submission

We can forward our reports and costings directly to your insurance company or loss adjuster, or if you prefer us to work through you or your representative this is just as easy. There is normally a period where the proposed works are considered and various questions are asked by the various parties involved before authorisation is given for the works to proceed.

6. Approval and Planning

Once approved we make contact with customers immediately and arrange for any paperwork to be completed. We will arrange for a start date at your property which is normally within five working days. In the interim we will be busy making all the arrangements for the work to start such as organising machinery & skips and compiling our Health & Safety documentation and making sure our allocated staff know exactly what the job entails.

7. Remediation

Our staff and project manager will arrive at your property and initially carry out preparatory works to protect your property and remove any obstacles to the work. They will then automatically proceed to the main body of work which often involves excavation with small narrow access diggers. Our staff are exceptionally well trained and very experienced, but we reinforce them with extensive management support so we can be sure your job gets the attention it needs. This allows us to problem solve any issues in real time, over come them and keep projects on track to complete in the shortest possible timeframe. We continually investigate whilst works progress to ensure that in the very rare circumstance that we uncover something we hadn't foreseen, this is dealt with immediately.

8. Validation

When we are completely satisfied that the damage has been made good we carry out a robust and scientific validation process. We gather soil samples from the sides and base of any excavation and forward them to an independent and fully accredited laboratory where they are analysed. Where appropriate we also collect air quality samples from your property to further demonstrate that your property has been brought back to a state where you can fully enjoy it once again. The analytical results provided by the independent laboratories is then carefully compared to recognised human health standards for the remediation of contaminated land so we can with confidence confirm that remediation has been achieved.

9. Reinstatement

Our in house and highly trained staff will reinstate your property, internally or externally to the highest standard. By having the majority of skills we need in house we can fully reinstate your property very quickly and efficiently. We take great pride in the work that we undertake and want our customers to be delighted with the care, attention and quality of work we produce.

10. Hand Over & Reporting

We like to conduct a handover meeting with clients if they are available to make sure any snags are dealt with. We will also provide a copy of the completion report that details everything that was done in order to remediate the property and the results of the validation that verify that the job is complete and the remedial objectives met.

Specialists In Emergency Management

We are the most experienced industry professionals with 25+ years of dealing with oil spills. We specialise in emergency response, preventing further loss and damage, so **call us now**.
